

SUMMARY

Appointed to turn around a stalled fintech startup; scaled it from 10K to 120K merchants processing 150M+ annual transactions within 18 months. Transformed enterprise deployment operations at a Fortune 50 company, tripling throughput with half the resources. Now leading platform and product delivery for regulated utility infrastructure supporting ~2M smart meters across two states. 20+ years of building what doesn't exist yet: seeing problems others accept as normal, reframing them, and creating solutions that change how organizations operate.

CAREER PROGRESSION

Head of Products | National Grid | 2022 – Present

Own the platform that powers National Grid's \$1.4B+ AMI program across architecture, data, integration, security, network, environments, and DevOps. Lead a cross-functional team of 30 supporting 8 downstream teams and 2M+ smart meters in NY and MA.

- Prevented \$2M+ in monthly losses by building defect tracking across all AMI QA operations and reframing vendor quality failures as financial decisions for executive leadership.
- Tripled deployment velocity by replacing manual email-based approvals with automated workflows and real-time release visibility.
- Cut feature delivery lead time by over 50% and reduced post-production defects by introducing end-to-end lifecycle measurement with lead and cycle times for the first time.
- Shipped every major AMI program milestone on schedule, achieving 100% of key objectives across 80+ features per PI.

Senior Technical Program Manager | Comcast | 2017 – 2022

Transformed operations and built the first analytics capability for data center network engineering, then recruited by division leadership to replicate both across enterprise cybersecurity. 30+ engineers.

- Increased successful deployment throughput by 200% across 4 major data centers and 100+ network facilities while reducing resource allocation by 50%.
- Established the organization's source of truth for executive visibility and decision-making across 20+ enterprise projects, replacing static reporting with near real-time analytics.
- Proactively built crisis response analytics during the Log4Shell event that became the operational backbone for Comcast's enterprise-wide remediation.
- Cut delivery timeline for the in-house cloud network buildout from 12 months to 6 with zero disruption to parallel initiatives.

MBA | Widener University | 2015 – 2017

Relocated to the US to operate at a scale where the impact could be global, not just regional.

Vice President, Payment Card Services | Infotech International | 2013 – 2015

Conceived the B2C payment services venture at parent company level. Stepped in after initial leadership failed, transforming a stalled 10K-merchant operation into 120K merchants processing 150M+ annual transactions, growing volume 54x within 18 months. 50+ employees, 700+ field technicians, 12 direct reports.

- Recovered a critical 60K terminal contract and scaled deployment capacity to 10K per month through first-to-market innovations in predictive merchant targeting, pull-based logistics, and automated remote terminal configuration.
- Displaced competitor terminals by creating the market's first bank-independent payment device, consolidating multiple bank accounts into a single terminal and increasing per-terminal transactions from 20 to 90 monthly.
- Co-architected the national card network at the central bank's table, unifying transaction routing, settlement, and security frameworks across 30+ financial institutions. Achieved 99.5/100 across compliance, quality, and performance.

Director, Products & Program Management Office | Infotech International | 2009 – 2013

Owned product vision, strategy, and roadmap across 7 engineering teams (40+ engineers). Created the PMO that became the central delivery engine for 20+ products across 30+ financial institutions in Southwest Asia, North Africa, and Western Europe.

- Captured 50% market share by building a portfolio of 20+ products worth \$250M+, including over 1M payment terminals, smart card solutions, network infrastructure, and value-added services.
- Revived an obsolete payment routing and network management product line from 20 units to 5,000+ by securing software ownership and rebuilding it with value-added capabilities no competitor could replicate.
- Generated multiple revenue streams by creating the e-voucher distribution platform processing 2M+ vouchers monthly, while giving banking partners a financial incentive to adopt our terminals.

Manager, Software Development | Infotech International | 2006 – 2009

Led 8 engineers and owned technical direction for the company's payment and terminal management products, turning delivery speed into the company's strongest competitive advantage.

- Cut payment application releases from 6-8 weeks to 3-5 days and terminal deployments from 5-6 months to 2-3 weeks by creating the market's first configuration-driven development platform.
- Scaled the customer base from 2 to 8 major financial institutions and the terminal network from 10K to 100K+ through speed and reliability no competitor could match.

Software Developer | Infotech International | 2004 – 2006

Delivered two market firsts:

- First remote terminal management system, eliminating physical servicing nationwide.
- First domestic POS application to process live transactions through the national payment switch.

ACADEMIC BACKGROUND

Adjunct Instructor | Widener University | 2021 – Present

Invited back by the university to design and teach graduate and undergraduate courses:

- Designed and launched Innovation Toolbox, a graduate course in design thinking, problem solving, Lean, and Agile principles.
- Modernized Database Management Systems curriculum with hands-on applied learning.

Education:

- **MBA, Strategic Leadership & Business Process Innovation** | Widener University, 2017
- **BS, Software Engineering** | Azad University, 2005

INDEPENDENT VENTURES

What I build when the problem is too interesting to ignore.

- **Project Lighthouse:** Rethinking how large organizations manage priorities and risk, replacing traditional PMO overhead with real-time visual alignment that requires zero active interference.
- **Jingle:** Challenging platform lock-in by building a cross-platform music app that lets users own their data and move freely between Spotify, Apple Music, and YouTube. Live on TestFlight.
